QUICK REFERENCE FOR HEALTHCARE PROVIDERS

MANAGEMENT OF

COLORECTAL CARCINOMA

Ministry of Health Malaysia
Malaysian Society of Colorectal Surgeons
Malaysian Society of Gastroenterology & Hepatology
Malaysian Oncological Society
Academy of Medicine Malaysia
KEY MESSAGES

1. Colorectal carcinoma (CRC) is the second most common cancer in Malaysia.
2. Screening of CRC should be offered at the age of 50 years & continues until 75 years old for average risk population. Immunochemical faecal occult blood test (IFOBT) is the preferred method.
3. Colonoscopy is the screening method for moderate & high risk groups.
4. All individuals with family history suggestive of a hereditary colorectal cancer syndrome should be referred to a clinical genetics service for genetic risk assessment, where accessible.
5. The use of carcinoembryonic antigen (CEA) is exclusively confined for monitoring & follow-up. It is performed pre-operatively for baseline investigation & surveillance. CEA should not be used as a screening method.
6. Computed tomography (CT) scan should be used for staging & surveillance of CRC. Magnetic resonance imaging (MRI) is the modality of choice in diagnosing & staging of rectal carcinoma.
7. Standardised histopathology reporting proforma incorporating tumour-node-metastasis (TNM) staging system should be used.
8. The mainstay of treatment for CRC is surgical resection, which offers the best curative outcome.
9. Chemotherapy & radiotherapy are used to downstage, as adjuvant therapy & for palliative purposes.
10. In advanced CRC, multidisciplinary team approach in patient management should be practised.

This Quick Reference provides key messages & a summary of the main recommendations in the Clinical Practice Guidelines (CPG) Management of Colorectal Carcinoma.

Details of the evidence supporting these recommendations can be found in the above CPG, available on the following websites:

- Ministry of Health Malaysia: www.moh.gov.my
- Academy of Medicine Malaysia: www.acadmed.org.my
- Malaysian Society of Colorectal Surgeons: www.colorectalmy.org
- Malaysian Society of Gastroenterology & Hepatology: www.msgh.org.my
- Malaysian Oncological Society: www.malaysiaoncology.org

**ALGORITHM B: PRIMARY CARE REFERRAL FOR SYMPTOMS OF COLORECTAL CARCINOMA**

**RISK CATEGORIES FOR FAMILY HISTORY WITH CRC**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
<th>Screening recommendation</th>
</tr>
</thead>
</table>
| Category 1 | No family history & age >50 years                                            | • Perform IFOBT (refer to Algorithm A).  
             |                                                                             | • Stop screening at age 75.                                                             |
| Category 2 | Family history of CRC either:                                               | • FDR with CRC diagnosed at age <60 years, colonoscopy should be performed at age 40 or 10 years younger than affected relative (whichever is younger). If normal, repeat every 3-5 years.  
             |   • ≥1 first-degree relatives (FDR)                                          | • FDR with CRC diagnosed at age ≥60 years, colonoscopy should be performed at age 40 years. If normal, repeat every 10 years.  
             |   • 1 FDR & >1 second-degree relatives                                       | • Stop screening at age 75.                                                             |
|             |   • >3 & one of them must be FDR                                            |                                                                                         |
| Category 3 | Family history of:                                                          | • For family history of CRC diagnosed at age <50 years, colonoscopy should be performed at age 40 or 10 years younger than affected relative (whichever is younger). If normal, repeat every 3-5 years. Stop screening at age 75.  
             |   • CRC at age <50 years                                                     | • For hereditary colorectal cancer syndromes, refer to Table 5 in CPG.                   |
|             |   • Familial adenomatous polyposis (FAP)                                    |                                                                                         |
|             |   • Hereditary non-polyposis colorectal cancer (Lynch Syndrome)              |                                                                                         |
|             |   • Peutz-Jegher Syndrome                                                   |                                                                                         |
|             |   • Juvenile Polyposis                                                      |                                                                                         |
|             |   • MUTYH-associated polyposis                                               |                                                                                         |

**INDICATIONS TO REFER FOR GENETIC RISK EVALUATION/ASSESSMENT**

- Personal history of CRC:
  - before age 50
  - and endometrial cancer at any age
  - and ovarian cancer at any age
  - and stomach, small bowel, biliary or urinary tract cancer at any age
  - and two FDRs with history of colorectal, endometrial or ovarian cancer at any age
- Family history of inherited syndromes such as Lynch, FAP or familial diffuse gastric cancer
- Personal history of 10 or more adenomatous polyps
- Personal history of multiple primary colon cancers at any age
- Cumulative >5 proximal serrated polyps, at least two >10 mm
- Cumulative >20 serrated polyps
- ≥2 juvenile or Peutz-Jeghers polyps
RADIOLOGICAL INVESTIGATIONS

- CT accuracy in identifying CRC & nodal metastases depends on the stage of the tumour. It is not the best modality for the assessment of early CRC.
- Radiological staging for CRC must include contrasted CT thorax.
- Radiological report must include pertinent findings for patient's optimal management e.g. TNM classification.
- MRI staging provides an accurate assessment of rectal carcinoma local spread pre-operatively.
- MRI is the best modality in assessing the relation of the rectal carcinoma with the potential circumferential resection margins (CRM). It predicts whether the surgical resection margin is clear or affected by the carcinoma.
- Contrast-enhanced 18F-fluorodeoxyglucose Positron Emission Tomography CT (FDG PET-CT) is preferred in the detection of extrahepatic metastases & local recurrence of CRC.
- FDG PET-CT has a role in the evaluation of recurrent CRC with elevated CEA & often with equivocal/negative CT.

SURGICAL MANAGEMENT

- A thorough surgical exploration should be performed at the time of resection in CRC.
- Low rectal surgery should be performed by surgeons credentialed in the management of rectal carcinoma.
- Total mesorectal excision (TME) should be performed for middle & low rectal carcinoma.
- If abdominoperineal resection (APR) is required, it should be performed as cylindrical APR.
- Treatment for metastatic CRC should be individualised & guided by a multidisciplinary approach.

CORE HISTOPATHOLOGICAL DATA REPORTING

<table>

QUICK REFERENCE FOR HEALTHCARE PROVIDERS MANAGEMENT OF COLORECTAL CARCINOMA

ALGORITHM A: SCREENING FOR COLORECTAL CARCINOMA

ASSESS PATIENT FOR SYMPTOMS OF CRC*

PRESENCE OF SYMPTOM(S)

NO

STRATIFY RISK FOR FAMILY HISTORY

CATEGORY 1 - AVERAGE RISK**

IMMUNOFAECAL OCCULT BLOOD TESTING (IFOBT)

POSITIVE

REFER FOR COLONOSCOPY

NEGATIVE

REPEAT IFOBT YEARLY

YES

REFER ALGORITHM B

CATEGORY 2 - MODERATE RISK**

CATEGORY 3 - HIGH RISK**

*Symptoms as outlined in Algorithm B.

**Refer to Table 4 on Risk Categories for Family History with Colorectal Carcinoma.
ALGORITHM B: PRIMARY CARE REFERRAL FOR SYMPTOMS OF COLORECTAL CARCINOMA

Presence of any of the following signs or symptoms:
- per rectal bleeding
- mucoid stool
- loss of weight or appetite
- abdominal discomfort
- altered bowel habits
- perianal symptoms
- tenesmus
- constipation
- anaemia
- palpable abdominal mass
- palpable anorectal mass

Focused history
- Age and sex
- Rectal bleeding (colour)
- Altered bowel habit (alternating constipation and diarrhoea)
- Perianal symptoms (lump, pruritus, pain, discharge)
- Symptoms of anaemia (look for causes)
- Personal history of colorectal polyps or inflammatory bowel disease, or family history of CRC

Focused physical examination and tests
- Weight
- Look for signs of anaemia
- Abdominal examination
- Digital rectal examination and proctoscopy
- Full blood count

Unexplained rectal bleeding with \( \geq 1 \) of the following:
- fresh blood
- blood mixed with stool
- with altered bowel habits
- with significant weight loss

AND/OR

Unexplained iron deficiency anaemia

AND/OR

Palpable abdominal or rectal mass

URGENT REFERRAL FOR COLONOSCOPY WITHIN TWO WEEKS

All other unexplained signs and symptoms that do not meet criteria for urgent referral

Treat signs or symptoms accordingly

Signs & symptoms not resolved in 4-6 weeks

REFER FOR ELECTIVE COLONOSCOPY
**QUICK REFERENCE FOR HEALTHCARE PROVIDERS MANAGEMENT OF COLORECTAL CARCINOMA**

1. Colorectal carcinoma (CRC) is the second most common cancer in Malaysia.

2. Screening of CRC should be offered at the age of 50 years & continues until 75 years.

3. ≥1 of the following:
   - Unexplained rectal bleeding with signs of anaemia
   - Palpable abdominal or rectal mass
   - Altered bowel habit (alternating constipation & diarrhoea)
   - Rectal bleeding (colour)
   - Perianal symptoms (lump, pruritus, pain, & discharge)
   - Abdominal discomfort
   - Loss of weight or appetite
   - Mucoid stool
   - Per rectal bleeding

4. Details of the evidence supporting these recommendations can be found in the evidence summary section of the Clinical Practice Guidelines (CPG), available on the following websites:
   - Malaysian Society of Gastroenterology & Hepatology
   - Academy of Medicine Malaysia
   - Malaysian Oncological Society
   - Ministry of Health Malaysia

5. Refer to the website for the comprehensive version of the CPG.

6. **ALGORITHM C: TREATMENT FOR COLON CARCINOMA**

   - **T1-T2 N0 M0**
     - Surgery
   - **T3-T4 N0 M0**
     - Surgery
   - **T1-T4 N1-N2 M0**
     - Surgery
   - **T1-T4 Any N M1**
     - Options include:
       - Curative or palliative surgery
       - Palliative chemotherapy
       - Best supportive care

   - Determine disease stage
     - *High risk features for stage II colon carcinoma are presence of any of the following:*
       - obstruction
       - perforation
       - T4 disease
       - poorly differentiated tumour
       - lymphovascular invasion
       - perineural invasion
       - inadequate lymph node sampling (<12)

   - No
     - High risk features*
       - Adjuvant chemotherapy
     - SURVEILLANCE
   - Yes
     - Adjuvant chemotherapy
     - SURVEILLANCE
**Algorithm D: Treatment for Rectal Carcinoma**

**Determine disease stage**

- **T1-T2 N0 M0**
  - Surgery
- **T3-T4 N0 M0 OR T1-T4 N1-N2 M0**
  - Surgery
  - Neoadjuvant CCRT
  - Adjuvant CCRT
  - Surgery
- **T1-T4 Any N M1**
  - Preferred option
  - Options include:
    - Surgery
    - Palliative radiotherapy
    - Palliative chemotherapy
    - Best supportive care

**Surveillance**

*High risk features for stage II rectal carcinoma are presence of any of the following:*
- obstruction
- perforation
- T4 disease
- positive CRM
- poorly differentiated tumour
- lymphovascular invasion
- perineural invasion
- inadequate lymph node sampling (<12)
- incomplete mesorectum

CCRT = Concurrent chemoradiotherapy
